## Measured modulation

**Fig. 1: Oscilloscope trace**

**Fig. 2: Carrier/sideband ratio**

**Table 1: Expected modulation**

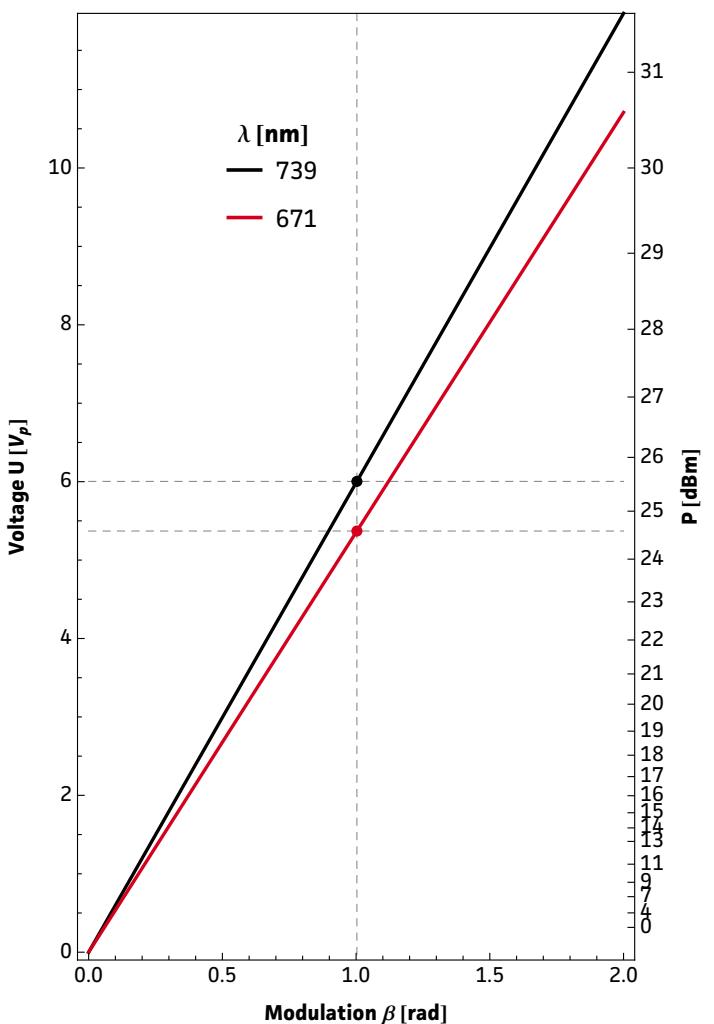

$\beta = 1 \text{ rad}$	unit	$\lambda_1$	$\lambda_2$
$\lambda$	nm	<b>671</b>	<b>739</b>
P	dBm	24.6	25.5
P	mW	286	359
U	$V_p$	5.4	6.
$U_\pi$	$V_p$	16.8	18.8
$\beta / U$	rad / V	0.19	0.17

**Fig.1:** Recorded oscilloscope trace retrieved from a test setup as illustrated below.

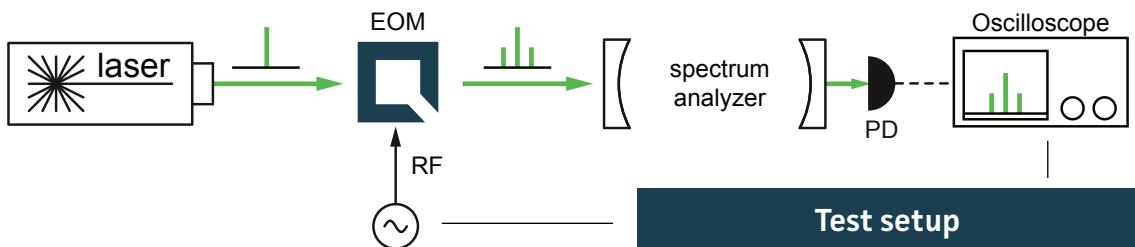

**Fig.2:** Squared absolute values of first-kind Bessel functions vs. modulation depth. Vertical lines reveal the ratio between the carrier  $|J_0|^2$  and the  $i^{\text{th}}$  sideband  $|J_i|^2$  at a specific  $\beta$ .

**Fig.3:** Dependency between RF amplitude and modulation depth for different wavelengths. Points on the curve allow to retrieve either the required RF amplitude for a specific/desired  $\beta$  or the max. achievable modulation depth for a given/available RF power.

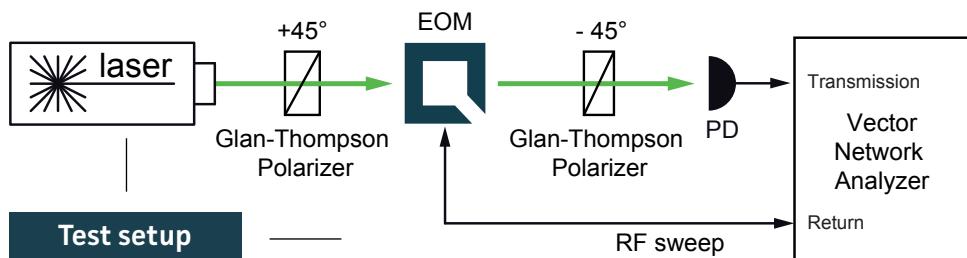

**Table 1:** Expected RF-amplitude/-power values and conversion factors for the required wavelength at the reference modulation depth of 1 rad. **Note:** Experimentally recorded modulation depth displayed in Fig.1 might vary from the respective values ( $\beta=1\text{rad}$ ) provided in the table.

## Tuning performance

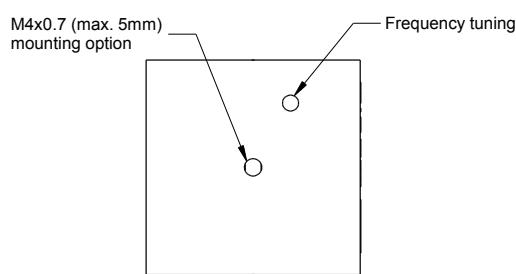

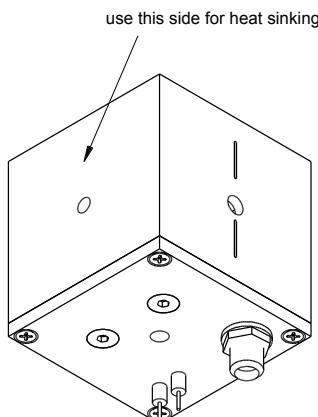

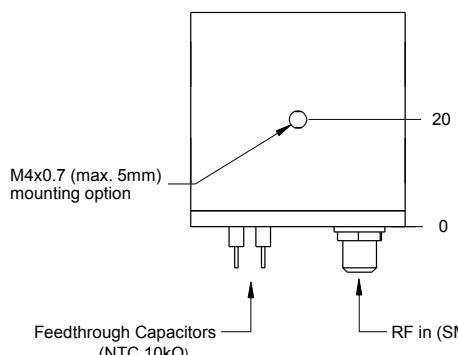

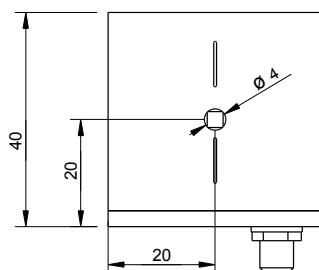

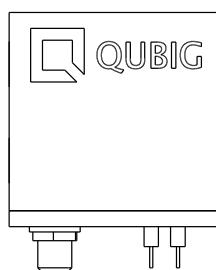

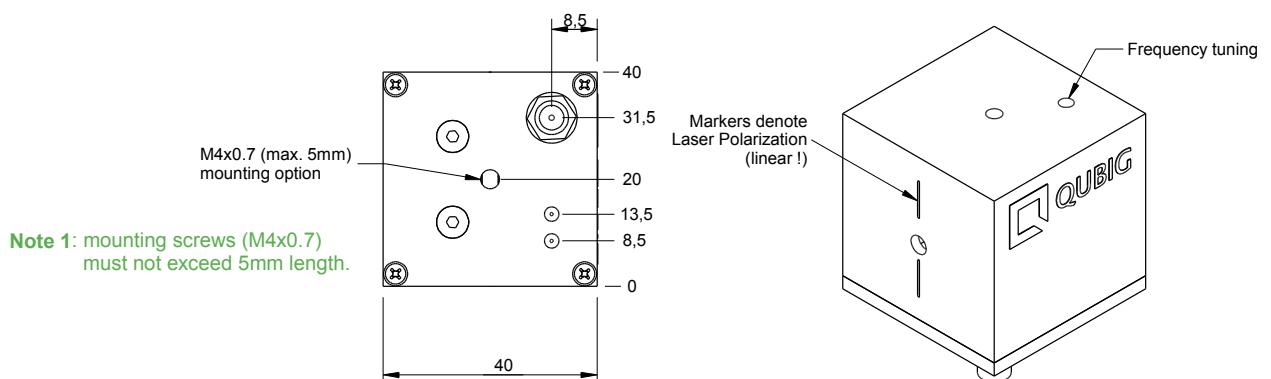

MAX resonance frequency	$f_0$ max	1099	MHz
MIN resonance frequency	$f_0$ min	984	MHz
number of turns	$N_{\max}$	6	
counter clock-wise turns ↗	higher $f_0$ ↑		
clock-wise turns ↘	lower $f_0$ ↓		

## Handling instructions

- Housing is hermetically sealed. There are no user serviceable parts inside. None of the screws must not be loosened at any time! Crystal will be damaged otherwise.
- Input laser polarisation must be orthogonally aligned with respect to the cooling fins
- Please handle device carefully. Avoid shock. Don't drop.
- After turn on the resonance frequency might drift slightly with applied rf power. Please compensate by tuning the rf drive frequency until steady-state (~min).
